December 1968

ABSTRACT

This report is concerned with a limited investigation of the 5.56mm cartridge, lot LC-12387, fired from M16A1 rifles using the standard flash suppressor, FSN-1005-933-8089.

Two 5000-round confirmatory tests were fired in M16A1 rifles at Frankford Arsenal using ammunition lot LC-12387. These tests have indicated the adequacy of this ammunition when fired in standard rifles with standard flash suppressors. There was no significant accumulation of cartridge residue in the bolt-carrier group of either of the rifles. Residue accumulation in the gas tube appeared normal as indicated by air flow readings and weight measurements.

Review of test data contained in U.S. Army Human Engineering Laboratories (USAHEL) Letter Report No. 88 has indicated that the use of noise suppressing muzzle attachments can seriously affect gas tube life in the M16A1 rifles.

INTRODUCTION

During July 1968, the USAHEL, Aberdeen Proving Ground, conducted noise level and cyclic rate tests on the M16A1 rifle fitted with various designs of noise suppressors. Ammunition used for these tests was Cartridge, 5.56mm, Ball, M193, lot LC-12387. Results of these tests were reported in USAHEL Letter Report No. 88¹ which noted: "The ammunition (M193, Lot LC-12387) is dirty ammunition."

At the request of the Project Manager, Rifles, WECOM, Rock Island, Illinois (see Appendix A), a limited firing test was conducted at Frankford Arsenal to determine whether subject lot (LC-12387) of ammunition should be suspended or restricted in use. This limited test was also to determine "fouling" characteristics of this ammunition lot in M16A1 rifles using the standard muzzle attachment, flash suppressor FSN-1005-933-8089.

Data contained in USAHEL Letter Report No. 88 which related to residue deposits were based on visual observation. Comparison procedures such as measuring barrel lands and grooves, weighing gas tubes and bolt components (prior and during testing), and obtaining periodic flow meter measurements through the gas tube, were absent from the report.

USAMUCOM Indorsement (Appendix A) requested investigation of the USAHEL Report considering the following points as a minimum:

"a. The comparability of the tests of lot LC-12387 and Lot RA-5276 (reported to be superior to lot LC-12387), particularly as concerns lubrication and cleaning procedures, rounds fired per day, length of test, and specific non-standard muzzle devices used.

b. The criteria applied by USAHEL in comparing "dirtiness" of different lots, e.g., visual, weight of fouling deposits, weapon malfunction rates, etc.

¹Letter Report No. 88 "Noise Measurements and Cyclic Rates for the M16 Rifle Equipped with Various Noise Suppressors," F.A. Spellman, D. L. Lince, Engineering Research Laboratory, USAHEL, Aberdeen Proving Ground Md., July 1968.

c. Correlation observed by USAHEL between "dirtiness" and progressive restriction of air flow through gas tube of M16A1 rifle, if the latter was measured.

d. The controls used in the tests to distinguish phenomena occurring in the standard M16A1 rifle from those occurring in M16A1 rifles modified by the addition of non-standard muzzle devices.

The USAHEL Letter Report No. 88 noted that the "ammunition used in the tests (lot LC-12387) is not comparable to ammunition used in previous testing such as lot RA-5276." Contact with the USAHEL disclosed that no direct comparison could be made between the two lots of ammunition because test conditions were different.

Frankford Arsenal plans called for the comparative firings of lot RA-5276 in addition to lot LC-12387, but ammunition from Lot RA-5276 could not be obtained.

DESCRIPTION OF TESTS

A total of 10,000 rounds of ammunition lot LC-12387 was obtained for this evaluation. Two firing tests were conducted consisting of 5000 rounds each in two separate rifles. Rifle A (SN 848305) was fitted with a new barrel (less than 70 rounds) and a new gas tube. Receiver history for Rifle A was 11,300 rounds prior to the test. Rifle B (SN 856760) had a barrel history of 20,000 rounds prior to this test. A new gas tube was also fitted to this rifle. Receiver history for Rifle B was 31,300 rounds prior to the test. Both rifles were inspected for bore characteristics and gas port location. These measurements are shown in Figures 1 and 2.

Fifty cycles of 100 rounds each were fired in each of the test rifles. A cycle consisted of five 20-round magazines loaded and fired as follows:

20 rounds semiautomatic, 1 shot per second

20 rounds semiautomatic, 1 shot per second

Figure 2. Bore Gaging Record, SN 856760, Rifle B

20 rounds semiautomatic, 1 shot per second

20 rounds automatic, 2 to 3 round bursts

20 rounds automatic, single burst of 20 shots during which the cyclic rate was recorded.

The rifles were air-cooled to ambient after each cycle. After five cycles, the complete bolt assemblies were lubricated using Lubricating Oil, Semifluid, MIL-L-46000.

After ten cycles, the flash suppressors were removed and gas tube flow meter measurements were recorded. The gas tubes were removed from the rifle and weighed. The rifles were then cleaned and lubricated in accordance with SAPD-253E, dated 5 July 1968.

Reassembled rifles were then fired and cleaned as scheduled above until completion of the tests.

TEST RESULTS

Lake City Army Ammunition Plant Inspection Report for lot LC12387 is shown in Appendix B. The 1000-round fouling test referred to in "Remarks" of Appendix B indicated only light fouling characteristics for this ammunition lot. Appendix C shows Ammunition Lot Inspection Report for lot RA-5276.

Acceptance history and criteria for ammunition lots LC-12387 and RA-5276 indicate that these cartridge lots met ballistic, mechanical, environmental and rifle functioning requirements for acceptance. Supplementary chemical and physical tests of ten sample bullet jackets from the cartridge lot LC-12387 show that they compared to physical and chemical acceptance requirements. Results of these analyses are shown in Frankford Arsenal Laboratory Report, see Figure 3.

Cyclic rate and flow meter data generated for each of the two test rifles are contained in Table I (Rifle A) and Table II (Rifle B).

Rifle A displayed a tendency to gain weight in the gas tube as firing progressed with an increase in flow meter readings and a decrease of cyclic rate, see Figure 4. The rifle barrel on this weapon had less than 70 rounds fired prior to this test.

Rifle B displayed the same tendencies as Rifle A. This rifle barrel had a previous history of 20,000 rounds, see Figure 5.

USAHEL reported rifle stoppages after firing approximately 300 rounds. In the Frankford Arsenal tests, four weapon stoppages were encountered in rifle A. These occurred at round numbers 2052, 4397, 4701, and 4975. Minimal malfunctions encountered during test of this rifle cannot be attributed wholly to gas tube clogging, but to mechanical problems normally associated with the bolt-chamber area of the weapon. Rifle B continued firing without mishap to the end of the 5000-round test.

Results of this limited test show that ammunition lot LC-12387 behaved markedly different than in the USAHEL tests of noise suppressors reported in Letter Report No. 88. Data indicate that restrictions to the gun muzzle presented by the various types of noise suppressors studied by the USAHEL, caused rapid or abnormal buildup of residue in the suppressors being tested, the gas tube, the bolt assembly, and the rifle bore.

Tabulated data abstracted from the USAHEL report are shown in Table III. These data include cyclic rate information up to the 700-round cleaning point where the USAHEL reported maximum difficulties in the bolt areas of the test rifles.

CONCLUSIONS

It is concluded that:

1. The 5.56mm, Ball, M193 ammunition lot LC-12387 is suitable for use in the standard 5.56mm, M16A1 Rifle with standard flash suppressor, FSN-1005-933-8089.

- ³Rifle cleaned after 600 rounds
- ⁴Not cleaned during entire test

2. Use of the standard flash suppressors instead of the non-standard noise suppressors tested by USAHEL, resulted in decreased fouling in the M16A1 rifle.

RECOMMENDATIONS

It is recommended that:

1. No restrictive measures be taken on the 5.56mm, Ball, M193 ammunition lot LC-12387.

2. Future testing and evaluation of non-standard muzzle attachments for the 5.56mm M16A1 rifle should include:

a. Use of standard reference rifle with standard flash suppressor.

b. Complete dimensional control of test barrels

c. Flowmeter readings through the rifle gas tube

d. Recording the weight of the gas tube prior to and during test

e. Recording the weight and dimension of the standard flash suppressor or non-standard muzzle attachment prior to and during the test

f. Recording the cyclic rate

3. Close surveillance of field use of M16A1 rifles with noise suppressors be initiated and maintained.

SUBJECT: 5.56mm M193 Ammunition, Lot LC12387

Commanding General
U. S. Army Munitions Command
ATTN: AMSMU-RE
Dover, New Jersey 07801

1. Reference: USAHEL Letter Report No. 88, dated July 1968, Title: Noise Measurements and Cyclic Rates for the M16 Rifle Equipped with Various Noise Suppressors.

2. The Reference report contains the following statements concerning ammunition:

"REMARKS"

"All weapons were excessively dirty after firing. The ammunition used in the test (Lot LC12387) is not comparable to ammunition used in previous testing, such as Lot RA5276".

"CONCLUSION"

"It is concluded that:

1. The ammunition (M193, Lot LC12387) is dirty ammunition".

3. It is requested that an investigation be made to determine whether the subject lot of ammunition should be suspended or restricted in use, and the Project Manager be notified at the earliest possible time of the action taken so that he can be responsive to inquiries which are expected in consequence of these statements in the Reference report. It is requested that you communicate directly with USAHEL for further information which will be required in your investigation.

FOR THE PROJECT MANAGER:

SUBJECT: 5.56mm M193 Ammunition, Lot LC12387

7 AUG 1968

HQ, US Army Munitions Command, Dover, New Jersey 07801

TO: Commanding Officer, Frankford Arsenal, ATTN: SMUFA-J1000,
Philadelphia, Pennsylvania 19137

1. The basic letter asks for an early determination of action required, if any, as a result of USAHEL report that lot LC 12387 (Cartridge 5.56mm Ball, M193) "is dirty ammunition." It is requested that you initiate an investigation of this USAHEL report and advise the Project Manager-Rifles and this headquarters by 19 Aug 68 what date your determination of appropriate action will be completed.

2. It is suggested that your investigation consider the following points as a minimum:

a. The comparability of the tests of lot LC 12387 and lot RA 5276 (reported to be superior to lot LC 12387), particularly as concerns lubrication and cleaning procedures, rounds fired per day, length of test, and specific non-standard muzzle devices used.

b. The criteria applied by USAHEL in comparing "dirtiness" of different lots e.g., visual, weight of fouling deposits, weapon malfunction rates, etc.

c. Correlation observed by USAHEL between "dirtiness" and progressive restriction of air flow through gas tube of M16A1 rifle, if the latter was measured.

d. The controls used in the tests to distinguish phenomena occurring in the standard M16A1 rifle from those occurring in M16A1 rifles modified by the addition of non-standard muzzle devices.

same subject: from Hq, USArmy Munitions Command,
to Commanding Officer, Frankford Arsenal.
2. Determination of action required, if any, as a
result of USAHEL report that lot LC12387 (Cartridge
5.56mm Ball, M193) "is dirty ammunition", will be
forwarded to your command by 19 September 1968.

Unclas TT from H2000 Signed D. H. Johnson, LTC, OrdC.
SUBJECT: 5.56mm M193 Ammunition Lot LC12387.

1. Reference: a. Letter AMCPM-RS 30 July 1968
b. 1st Indorsement AMSMU-RE-M
7 August 1968
c. TT, SNUFA-H2000 19 August 1968

2. Investigation of ammunition lot LC12387 was conducted as noted in reference 1 and 2. No compatibility data exists between USAHKL tests of LC 12387 and RA5276. Only visual observation was made by USAHKL during tests which led to conclusion that LC12387 "dirty" ammunition. In addition, standard rifle controls were not employed during USAHKL tests. I.E. Bore measurements, weighing gas tubes and bolt components and use of flowmeter

data to monitor build-up of gas tube residue.

3. 10,000 rounds of LC12387 were fired at FA in two control rifles. (5000 rounds each). These tests fired under controlled conditions clearly indicate adequacy of ammunition LC12387 when fired in standard rifles with standard muzzle attachment. Indication also exists that use of non-standard muzzle attachments seriously effects gas tube life in the M16A1 Rifle. USANGL letter report No. 88 records rifle malfunctions as early as 300 rounds after start of tests using non-standard muzzle attachments. (NOISE SUPPRESSORS) FA tests in one control rifle yielded evidence of gas tube clogging after 4397 rounds although the rifle completed the 5000 rounds, while the other control rifle continued to fire without malfunction to 5000 rounds.

4. Complete report being prepared and will be forwarded on 23 September 1968.

13. ABSTRACT <p>This report is concerned with a limited investigation of the 5.56mm cartridge, lot LC-12387, fired from M16A1 rifles using the standard flash suppressor, FSN-1005-933-8089.</p> <p>Two 5000-round confirmatory tests were fired in M16A1 rifles at Frankford Arsenal using ammunition lot LC-12387. These tests have indicated the adequacy of this ammunition when fired in standard rifles with standard flash suppressors. There was no significant accumulation of cartridge residue in the bolt-carrier group of either of the test rifles. Residue accumulation in the gas tube appeared normal as indicated by air flow readings and weight measurements.</p> <p>Review of test data contained in U.S. Army Human Engineering Laboratories (USAHEL) Letter Report No. 88 has indicated that the use of noise suppressing muzzle attachments can seriously affect gas tube life in the M16A1 rifles.</p>
